Abstracts

Bone Anchored Hearing Aids (BAHA) implants are specialized hearing devices designed for individuals with conductive or mixed hearing loss, or single-sided deafness. Unlike traditional hearing aids that amplify sound through the ear canal, BAHA implants work by directly transmitting sound vibrations to the inner ear through the skull bone. The system consists of a small titanium implant surgically placed in the skull bone behind the ear, which connects to an external sound processor. By bypassing the outer and middle ear, BAHA implants offer an effective hearing solution for patients who cannot benefit from conventional hearing aids.

The global Bone Anchored Hearing Aids Baha Implants market size was estimated at USD 219.52 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.10% during the forecast period.
