Abstracts

Bone conduction headsets are a specialized category of audio devices that transmit sound through vibrations directly to the cochlea via the bones of the skull, bypassing the eardrum entirely. This technology allows users to listen to audio while maintaining awareness of ambient sounds, making them particularly suitable for athletes, cyclists, and individuals with hearing impairments or specific occupational needs. Unlike traditional headphones, bone conduction headsets do not obstruct the ear canal, offering a unique combination of situational awareness and audio accessibility, though they often trade off some audio fidelity and bass response compared to conventional options.

The global Bone Conduction Headset market size was estimated at USD 1050.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 15.50% during the forecast period.
