Report Overview

A bone anchored hearing aids is a surgically implanted device designed to help people with particular forms of hearing loss who cannot be helped with conventional hearing aids. The majority of the conventional hearing aids transmit sound through the medium of air conduction. The bone anchored hearing aids implant stimulates the cochlea by transmitting the sound waves through the bones in our skull, thereby bypassing the outer and middle ear. Once the cochlea receives the sound signals, the information is converted in to neural signals and transferred to the brain, where it is perceived as sound, thereby bypassing the outer and middle ear.
