Abstracts

Bone graft alternatives refer to a diverse range of synthetic, biological, or composite materials used to replace or augment the body's natural bone regeneration process in orthopedic, dental, and spinal surgeries, serving as substitutes for autografts (patient's own bone) or allografts (donor bone). These materials are designed to provide osteoconductive, osteoinductive, or osteogenic properties to support bone healing, and include categories such as demineralized bone matrices (DBMs), synthetic ceramics (e.g., calcium phosphates), bone morphogenetic proteins (BMPs), and cell-based therapies, offering solutions that minimize donor site morbidity, reduce infection risks, and address limitations in graft availability. The market for bone graft alternatives is expanding due to an aging global population, rising incidence of bone disorders and trauma, advancements in material science, and growing preference for minimally invasive surgical techniques, with key drivers including the increasing volume of spinal fusion procedures, dental implantology, and joint reconstruction surgeries, alongside ongoing innovations in bioresorbable and 3D-printed scaffolds that enhance integration and healing outcomes.

The global Bone Graft Alternatives market size was estimated at USD 3789.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
