Abstracts

Bone Graft Materials are biological or synthetic substances used to replace missing bone or to promote new bone growth in areas of bone defects or loss. They play a crucial role in orthopedic, dental, and spinal surgeries where natural bone is insufficient for healing. Bone grafts function by offering osteoconductive scaffolding, osteoinductive signaling, or osteogenic cells to stimulate bone regeneration. These materials can be classified into four main categories: autografts (bone harvested from the patient's own body), allografts (donor bone from another human), xenografts (bone from animal sources, usually bovine), and synthetic grafts (made from biocompatible materials such as calcium phosphate, hydroxyapatite, or bioactive glass). Each type has unique advantages and limitations regarding integration, healing time, risk of disease transmission, and immune response. Bone graft materials are commonly used in trauma repair, spinal fusion, joint reconstruction, periodontal surgery, and maxillofacial procedures. The global bone graft materials market is experiencing consistent growth, fueled by the rising number of orthopedic surgeries, an aging population, and the increasing incidence of bone-related disorders such as osteoporosis, arthritis, and traumatic injuries. Demand is particularly strong in spinal fusion and dental bone graft procedures. North America dominates the market due to advanced healthcare infrastructure and high adoption of innovative grafting solutions. However, Asia-Pacific is emerging rapidly owing to expanding healthcare access and surgical volumes. Technological developments such as the use of bioactive materials, synthetic grafts, and regenerative medicine approaches are driving product innovation.

The global Bone Graft Materials market size was estimated at USD 998.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
