## Abstracts

Bone stimulation devices are medical apparatuses designed to promote and accelerate bone healing through the application of targeted energy, such as low-intensity pulsed ultrasound (LIPUS), pulsed electromagnetic fields (PEMF), or capacitive coupling, which stimulate cellular activity, enhance blood flow, and encourage osteogenesis in cases of non-union fractures, spinal fusion surgeries, or delayed healing. These devices are categorized as non-invasive or minimally invasive therapeutic solutions, often used as adjuncts to traditional orthopedic treatments, and are regulated as Class II or Class III medical devices depending on their mechanism and application. The market is primarily driven by the rising incidence of osteoporosis, an aging global population, increasing sports-related injuries, and advancements in biomedical technology that improve efficacy and patient compliance. Key players include orthopedic specialists, hospitals, ambulatory surgical centers, and home-care settings, with growth further supported by clinical evidence demonstrating reduced healing times and cost savings in postoperative care. However, market expansion faces challenges such as high device costs, limited reimbursement policies in certain regions, and the need for greater awareness among both patients and healthcare providers regarding the benefits of bone stimulation therapies. Geographically, North America and Europe dominate due to well-established healthcare infrastructure and higher adoption rates, while Asia-Pacific shows significant growth potential fueled by improving medical access and rising healthcare expenditure.

The global Bone Stimulation Devices market size was estimated at USD 250.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
