## Abstracts

Bone trauma fixation screws are specialized medical devices used in orthopedic surgery to secure broken or fractured bones, ensuring they remain in place to heal correctly. Made of materials like titanium or stainless steel for strength and biocompatibility, these screws provide stabilization by creating a fixed attachment to the fractured bone parts. They are designed to be durable, resistant to body fluids, and promote optimal healing conditions while allowing the patient to regain movement gradually during recovery. Depending on the bone and fracture type, screws may vary in size, design, and threading to meet specific surgical requirements.
