Report Overview:

The borate minerals are minerals which contain a borate anion group. The borate (BO_3) units may be polymerised similar to the SiO_4 unit of the silicate mineral class. This results in B_2O_5 , B_3O_6 , B_2O_4 anions as well as more complex structures which include hydroxide or halogen anions. The $[\text{B}(\text{O},\text{OH})_4]^-$ anion exists as well.

Many borate minerals, such as borax, colemanite, and ulexite, are salts: soft, readily soluble, and found in evaporite contexts. However, some, such as boracite, are hard and resistant to weathering, more similar to the silicates.

The Global Borate Mineral Market Size was estimated at USD 2080.23 million in 2023 and is projected to reach USD 2835.84 million by 2029, exhibiting a CAGR of 5.30% during the forecast period.
