Abstracts

A borated polyethylene sheet is a specialized composite material that combines the properties of polyethylene, a common thermoplastic polymer known for its flexibility, durability, and chemical resistance, with boron or boron compounds. The addition of boron imparts unique characteristics to the polyethylene matrix. Boron has a high neutron absorption cross-section, which makes borated polyethylene sheets highly effective in applications where neutron shielding is required, such as in nuclear facilities, research laboratories, and medical settings involving radiation sources. The sheets can vary in thickness and density depending on the specific application requirements. They are typically lightweight compared to traditional shielding materials like lead, yet offer significant protection against neutron radiation. Additionally, the inherent properties of polyethylene, such as its ease of fabrication, low friction, and resistance to moisture and many chemicals, are retained in the borated version, making borated polyethylene sheets versatile for use in various environments where both radiation protection and other material properties are essential.

The global Borated Polyethylene Sheet market size was estimated at USD 261.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
