Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Boron-10 Isotope competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Boron-10 Boric Acid ($\text{H}_3^{10}\text{BO}_3$) is a common form of stable isotope of Boron-10. It is enriched from naturally occurring abundance up to 95 at%. Boric-10 Acid is one of stable isotopes for nuclear power generation, medical treatments and as target materials for other applications. Boron-10 boric acid (^{10}B boric acid), as a boron isotope enrichment product, is a key material in the nuclear industry for controlling the speed and intensity of neutron reactions and ensuring safety and control. Natural boron contains approximately 19.9% ^{10}B , but the nuclear industry and neutron capture therapy typically require ^{10}B enrichment levels exceeding 95%. Due to the high cost, complex equipment, and high technical barriers associated with isotope separation processes (such as gas diffusion, centrifugation, and ion exchange), ^{10}B boric acid is a typical "small-batch, high-purity, high-value-added" isotope material. While global annual demand is only a few hundred tons, unit price and supply bargaining power are extremely high. From the supply side, global ^{10}B enrichment capacity is highly concentrated in a few countries and companies, notably 3M in the United States. In recent years, Japan and China have also developed and produced high-end BNCT medical and nuclear reactor safety products. While their overall development is rapid, they are significantly impacted by nuclear export controls and isotope trade restrictions. Overall, Boron-10 Boric Acid is a typical "strategic-grade, small, and expensive" high-end material, requiring extremely high supply stability, safe inventory, and international compliance requirements. Leading players seeking to establish a presence in the market must either master the core isotope enrichment process and establish strong partnerships with leading downstream nuclear power and BNCT companies, or partner

with research institutions and large-scale medical accelerators to target the high-purity medical-grade market and avoid the inflated prices associated with industrial-grade products.

The global Boron-10 Isotope market size was estimated at USD 111.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.60% during the forecast period.
