## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Botryoidal Pyrolusite competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Botryoidal Pyrolusite is a manganese dioxide (MnO<sub>2</sub>) mineral with distinctive grape-like formations and a black to steel-gray luster, formed by low-temperature precipitation from manganese-rich fluids. Its supply chain starts with mining in regions such as South Africa, Gabon, Australia, India, and China, followed by crushing, washing, and beneficiation to concentrate MnO<sub>2</sub>. Midstream refining involves chemical or electrolytic processes to produce high-purity material, which is then used downstream in steelmaking, batteries, glass decolorization, and water treatment. In 2024, global production reached 780,000 tons, with a capacity of 1.0 million tons, unit prices of USD 1,200-2,400 per ton, and an average gross margin of 21%.

The global Botryoidal Pyrolusite market size was estimated at USD 1047.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
