Abstracts

Post-consumer plastic recycling refers to the process of collecting and reprocessing plastic waste generated by consumers to produce high-quality secondary raw materials. This process typically involves sorting, washing, and transforming used plastic items, such as bottles and packaging, into reusable materials that can replace virgin plastic in manufacturing. By compressing plastic waste into bottle bricks before transportation, costs are reduced, and efficiency is improved, making recycling operations more sustainable.The market for post-consumer plastic recycling is growing rapidly due to rising environmental concerns, regulatory policies, and corporate sustainability goals. Governments worldwide are introducing stricter waste management regulations and extended producer responsibility (EPR) programs, encouraging industries to adopt recycled plastics. The demand for food-grade recycled polyethylene terephthalate (rPET) and other high-quality recycled materials is increasing, particularly in packaging, textiles, and automotive sectors.Advancements in recycling technologies, including AI-driven sorting systems and chemical recycling methods, are enhancing efficiency and product quality. Many global brands are committing to higher recycled content in their packaging, fueling investment in recycling infrastructure. Additionally, circular economy initiatives are gaining momentum, with companies and governments promoting closed-loop recycling systems to reduce dependency on virgin plastic and minimize environmental impact.

The global Bottle Brick Recycling market size was estimated at USD 18150.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
