## Abstracts

A bottom watering pot is designed to supply water to plants from below. These pots typically include a flowerpot and a water storage container. Water is absorbed from the container into the soil via capillary action through cotton ropes or non-woven fabric sheets. These pots are ideal for plants that require consistent moisture without overwatering. They are particularly useful for plants like cyclamen that are sensitive to water on their bulbs. Bottom watering pots offer a solution to avoid the risk of root rot caused by excessive water retention at the bottom of traditional pots.

The global Bottom Watering Pot market size was estimated at USD 380.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
