## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Bovine Colostrum competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Bovine Colostrum is a milky fluid that comes from the breasts of cows the first few days after giving birth, before true milk appears. It contains proteins, carbohydrates, fats, vitamins, minerals, and proteins (antibodies) that fight disease-causing agents such as bacteria and viruses. Antibody levels in colostrum can be 100 times higher than levels in regular cow's milk. The average gross profit margin in this industry is around 60%. In 2024, global Bovine Colostrum production reached approximately 3,637 tons, with an average global market price of around US\$ 53.1 per kg.
