Abstracts

A Bovine Pericardial Tissue Valve is a type of biological heart valve made from the pericardium (the membrane surrounding the heart) of cows. These valves are treated and processed to be biocompatible and are typically used for heart valve replacement surgeries. The bovine tissue provides excellent durability and function as a valve material.

Market Overview: Bovine pericardial valves are commonly used in patients who require a bioprosthetic valve for conditions like aortic stenosis or mitral valve regurgitation. They are favored for their natural flexibility, reduced risk of clotting, and lower need for long-term anticoagulation compared to mechanical valves.

Market Drivers: Increased demand for bioprosthetic valves over mechanical valves due to their better long-term outcomes and reduced clotting risks. Technological improvements in tissue preservation, leading to better valve longevity and patient outcomes. Favorable clinical outcomes, especially in elderly patients and those at high risk for anticoagulant therapy complications.

Market Opportunities: Ongoing research into improving the durability and anti-calcification properties of bovine pericardial valves. Expansion of the market in emerging economies where the prevalence of valvular heart disease is rising, but advanced healthcare options are still growing.

Market Limitations: Bovine pericardial valves typically have a shorter lifespan compared to mechanical valves, which may necessitate reoperation in younger patients. Concerns about the long-term durability of bovine tissue and the potential for valve degeneration.

The global Bovine Pericardial Tissue Valve market size was estimated at USD 2527.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.10% during the forecast period.
