Abstracts

Box corer is a scientific instrument used for collecting sediment samples from the ocean floor or lake beds. It is designed to obtain samples with minimal disturbance to the sediment layers, preserving the stratigraphy and integrity of the sample. A box corer consists of a square or rectangular frame that houses a sample box or chamber with open ends. The corer is lowered to the seabed or lake floor, and upon impact, the sample box is triggered to close, capturing a section of sediment. The box corer is then retrieved, bringing the intact sediment core back to the surface for analysis. Box corers are commonly used in marine research to study sediment composition, geological processes, paleoclimate reconstruction, and studying benthic ecosystems. They provide valuable insights into the history and characteristics of sediment layers and help scientists understand past environmental conditions and changes.
