Abstracts

Braf kinase inhibitors represent a class of targeted cancer therapeutics designed to specifically inhibit the activity of the BRAF protein, a key component of the MAPK/ERK signaling pathway that, when mutated (particularly the V600E mutation), drives uncontrolled cell proliferation in various cancers. These small molecule drugs work by binding to the mutant BRAF enzyme, blocking its ability to transmit growth signals, thereby slowing or stopping tumor progression in malignancies such as melanoma, non-small cell lung cancer, colorectal cancer, and thyroid cancer. The development and clinical application of these inhibitors are grounded in precision medicine principles, as their efficacy is highly dependent on the presence of specific genetic alterations, making companion diagnostics an integral part of their utilization.

The global Braf Kinase Inhibitors market size was estimated at USD 1050.3 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
