Report Overview

Bragg fiber is a subset of photonic bandgap fibers, has a solid or hollow core surrounded by periodic dielectric nanolayers with low and high reflective indexes. Because of optical interference in their microstructure, the Bragg fibers are colorful under ambient illumination. However, no colorants or dyes are used in preparation of such fibers and therefore these fibers are not susceptible to color fading. Moreover, due to photonic band gap effect, Bragg fibers guide the light in the lower reflective index core and uniformly emit a portion of guided color without any requirement of mechanical perturbations. Therefore, these fibers are mechanically superior to the other light emitting fibers. By varying the number of layers in the Bragg reflector, the intensity of side emission can be controlled. On the other hand, the overall color of Bragg fiber can be varied by controlling the relative intensities of ambient light and guided light, which enable passive color change in textiles. Furthermore, with stretching of PBG Bragg fibers, the reflected colors also change proportionally to the extent of stretching.

The global Bragg Fiber market size was estimated at USD 102 million in 2023 and is projected to reach USD 166.56 million by 2032, exhibiting a CAGR of 5.60% during the forecast period.

North America Bragg Fiber market size was estimated at USD 29.19 million in 2023, at a CAGR of 4.80% during the forecast period of 2024 through 2032.
