Report Overview

The "Brain on a Chip" refers to an advanced bioelectronic system that mimics neural structures and functions by integrating living brain cells or synthetic neural networks with microfluidic and microelectrode arrays on a semiconductor chip. This technology combines neuroscience, bioengineering, and artificial intelligence to replicate aspects of brain activity, such as learning, memory, or sensory processing, in a controlled in vitro environment. It serves as a scalable, ethically viable alternative to animal testing for neurological research, drug development, and neuroprosthetics while also enabling breakthroughs in neuromorphic computing. The chip's design varies from organoid-based models using lab-grown human brain tissue to fully synthetic neural networks that emulate synaptic plasticity. Applications span neurodegenerative disease modeling, AI hardware optimization, and brain-machine interfaces, positioning it at the intersection of biotechnology and next-generation computing.
