Report Overview

A Brake Cylinder, also known as a brake caliper or wheel cylinder, is a crucial component of a vehicle's braking system. It is responsible for converting the hydraulic pressure generated by the master cylinder into mechanical force, which is then applied to the brake pads or shoes to create friction against the brake rotor or drum. This friction effectively slows down or stops the vehicle. Brake cylinders are typically made of aluminum or cast iron and are designed to withstand high pressures and temperatures. They are an essential part of ensuring the safety and performance of a vehicle's braking system, as they directly influence the braking efficiency and response time.
