Abstracts

The brake lining shoe market refers to the market for components used in drum brake systems of vehicles. Brake lining shoes are essential components that provide the friction necessary to stop or slow down a vehicle when the brakes are applied. Brake lining shoes are typically made from a friction material, commonly known as brake lining or brake pad material. This material is designed to provide high friction and heat resistance while maintaining durability and minimizing wear on the brake drum. The demand for brake lining shoes is influenced by factors such as vehicle production, vehicle fleet size, and brake system maintenance and replacement needs. As vehicles age or accumulate mileage, brake lining shoes wear down and require replacement to ensure optimal braking performance and safety. In recent years, there has been a shift in the automotive industry toward disc brake systems, which offer improved braking performance and reliability. However, drum brake systems are still used in many vehicles, especially in the rear axle, and there is still a demand for brake lining shoes for these applications.

The global Brake Lining Shoe market size was estimated at USD 9141.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.60% during the forecast period.
