Abstracts

Brake pad friction material refers to the material that is used on the surface of brake pads to create friction against the rotor when the brakes are applied. This friction is what slows down and ultimately stops the vehicle. The type of friction material used can vary depending on the specific needs of the vehicle, such as performance, durability, and noise reduction. Common materials used for brake pad friction material include organic, semi-metallic, and ceramic compounds. The quality and composition of the friction material can greatly affect the braking performance and overall safety of the vehicle.

The global Brake Pad Friction Material market size was estimated at USD 2868.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.80% during the forecast period.
