Report Overview

branched aortic stent-graft system refers to a specialized medical device used in endovascular surgery for the treatment of complex aortic aneurysms or dissections. It consists of a stent-graft, a fabric tube reinforced with metal stents, that is designed to be inserted into the aorta through minimally invasive procedures. What sets it apart is the inclusion of branching attachments or sidearms, which extend from the main body of the stent-graft to provide support to vital branch arteries, such as those supplying blood to the kidneys, mesenteric arteries, or other critical vessels. This technique allows for precise repair and reinforcement of the aortic wall while preserving blood flow to important organ arteries.
