Report Overview

Brass Press-fit technology allows manufacturers to avoid soldering when assembling PCB electronics. The press-fit connection is formed when a pin is pressed into a fitted, plated-through hole in a PCB.

There are different types of press-fit connectors, including those with solid pins (which don't contort during insertion) and compliant pins (which compress or "comply" during insertion). Solid press-fit technology came first, but designers and manufacturers were concerned about the board damage caused by solid press-fit contacts. To combat the problem, compliant press-fit technology was developed. Today, compliant pins are generally preferred because they make less demands on the PCB, require less force during the insertion process, and produce more reliable results (with less damage). Both types are still currently used, but compliant technology tends to be more convenient and effective (and thus, more popular).
