Abstracts

Brazed composite aluminum is a material designed specifically for automotive heat transfer systems and is widely used in components such as radiators, condensers, evaporators and oil coolers in automotive cooling systems. The material is composed of an aluminum alloy layer and a brazing material, and forms a high-strength connection through a brazing process. It has excellent thermal conductivity and corrosion resistance. The structure of the composite aluminum material usually includes a core aluminum alloy layer, a brazing coating and an anti-corrosion coating to ensure its stability and durability under high temperature, high pressure and harsh environments. The lightweight characteristics of brazed composite aluminum materials help reduce the overall weight of the vehicle, thereby improving fuel efficiency and reducing emissions, which meets the modern automotive industry's demand for energy conservation and environmental protection. With the development of new energy vehicles, the application of brazed composite aluminum materials in battery thermal management systems is also increasing, supporting the further evolution of vehicle thermal management technology.

The global Brazed Composite Aluminum for Automotive Heat Transfer market size was estimated at USD 3328.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
