Abstracts

Brazing laminar composites refer to advanced materials produced by joining multiple dissimilar metal layers through a brazing process, which involves melting a filler metal with a lower melting point than the base materials to form a metallurgical bond without fully melting the substrates. These composites combine the distinct properties of different metals?such as high strength, thermal conductivity, corrosion resistance, or lightweight characteristics?into a single, integrated structure, making them particularly valuable in applications requiring tailored performance, such as aerospace heat exchangers, electronic packaging, automotive components, and energy systems where thermal management and structural efficiency are critical.

The global Brazing Laminar Composites market size was estimated at USD 1200.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
