Report Overview

A Breakaway Coupling is a specialized mechanical device used in various industrial applications, particularly in fluid transfer systems such as those involving gases or liquids. It is designed to provide a secure connection between two components, such as pipes or hoses, while allowing for a safe and controlled disconnection under specific conditions. The primary function of a breakaway coupling is to prevent damage to the connected equipment or potential hazards in case of accidental separation. It typically features a fail-safe mechanism that enables one part of the coupling to detach from the other in a controlled manner, often triggered by a force threshold or a manual release. This design ensures that the disconnection does not lead to leakage, damage, or other safety issues, making it an essential component in applications where the integrity of the connection is critical, such as in chemical processing, oil and gas transportation, and emergency response scenarios.
