Report Overview:

A breast biopsy site marker is a small metal clip or tag that is placed in the breast during a biopsy to mark the area where the biopsy was taken. The marker is left inside the breast so it can be seen on a mammogram or other imaging test performed in the future. This helps the surgeon find the exact area again if more breast tissue needs to be removed later on.

Breast biopsy site markers are typically made of titanium or stainless steel. They are small and lightweight, and they do not cause any pain or harm to the body. The markers are placed in the breast during the biopsy procedure under local anesthesia. The surgeon will make a small incision in the skin and insert a thin needle into the breast. The needle will be used to guide the placement of the marker. Once the marker is in place, the surgeon will remove the needle and stitch up the incision.

The Global Breast Biopsy Site Marker Market Size was estimated at USD 674.40 million in 2023 and is projected to reach USD 1000.80 million by 2029, exhibiting a CAGR of 6.80% during the forecast period.
