Abstracts

Breast blood oxygen imaging examination device is a medical device used to measure the oxygen level in breast tissue. These instruments use a technique called scattering optical spectroscopy (DOS) to generate images of breast tissue and detect any abnormalities or conditions that affect breast tissue. DOS technology utilizes near-infrared light to penetrate breast tissue and measure the oxygen content in the tissue. This instrument uses a series of sensors and detectors to measure the light absorbed and scattered by breast tissue. By analyzing the data collected by the instrument, doctors can determine the oxygen levels in breast tissue and detect any abnormalities or conditions that affect breast tissue. Mammary blood oxygen function imaging instrument is usually used for diagnosis and treatment of breast cancer.
