Abstracts

A breast minimally invasive biopsy needle, often referred to as a vacuum-assisted biopsy (VAB) or core biopsy needle, is a specialized instrument used to obtain tissue samples from the breast for diagnostic purposes. Unlike traditional surgical biopsies, this procedure is minimally invasive, performed through a small incision in the skin. The needle, typically guided by ultrasound or mammography, uses a rotating cutting mechanism and vacuum suction to collect multiple tissue samples with a single insertion. This allows for a larger tissue sample compared to fine-needle aspiration, improving diagnostic accuracy, especially for microcalcifications or small lesions.
