Report Overview

The Breast Magnetic Resonance Imaging Coil(Breast MRI Coil) is a specialized device used in magnetic resonance imaging (MRI) of the breast. It consists of a flexible, flat cushion-like structure that is placed around the breast to be imaged. The coil works by detecting the electromagnetic signals emitted by hydrogen atoms in the breast tissue when they are exposed to a strong magnetic field and radio waves. Breast MRI coils are designed to provide high-resolution images of the breast, which can be used to detect and diagnose a range of conditions, including breast cancer. The use of a breast MRI coil can also help to distinguish between different types of breast tissue and can provide more detailed information than traditional mammography or ultrasound imaging.
