Abstracts

A breath-actuated inhaler is a drug delivery device triggered by the patient's respiratory airflow, used to treat respiratory diseases such as asthma and chronic obstructive pulmonary disease (COPD). Unlike traditional pressurized metered-dose inhalers (pMDIs) or dry powder inhalers (DPIs), a breath-actuated inhaler does not require the patient to coordinate the inhalation and compression movements, but instead uses the patient's natural respiratory airflow to release the drug, improving the efficiency of drug delivery and patient compliance. Its design is particularly suitable for children, the elderly or patients with poor coordination.

The global Breath-actuated Inhaler market size was estimated at USD 8832.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
