### Report Overview:

A breath alcohol sensor refers to an ignition interlock device that requires drivers to provide a breath sample in order to start their vehicle. This type of system typically uses infrared spectroscopy or fuel cell technologies to measure blood alcohol concentration present in exhalations by comparing detected ethanol molecules against known absorption patterns at specific wavelengths. It functions as a deterrent measure discouraging drunk driving behavior by adding another step necessary for operating a motorized vehicle safely beyond standard keyswitch activation procedures commonly used in passenger cars worldwide.
