## Abstracts

A breather membrane is a thin sheet of fabric that sits above insulation and rafters, but underneath the roof slates. The construction of the fabric allows any condensation to rise up into the roof void but prevents the condensing water from dripping back down into your roof. Instead, it channels the water down into the gutter, preventing many problems. Breathable membranes for walls tend to be of a generally lower specification than those used within roofs due to the nature of the application. Normally a roof breather would also be suitable as a high specification wall breather, but a wall breather would almost certainly not be suitable for use in a roof.

The global Breather Membrane market size was estimated at USD 154.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
