Abstracts

Bridge overload detection involves deploying dynamic weighing systems (WIM), strain sensors, displacement meters, accelerometers, and other monitoring equipment to conduct real-time weighing and load analysis of vehicles passing through bridges. This system identifies and records key data such as axle weight, gross weight, speed, and transit time of overloaded vehicles. It also assesses the instantaneous stress, deformation, and fatigue damage caused by overloading on the bridge structure. The goal is to prevent structural damage or accidents caused by the passage of overweight vehicles. This detection serves as an important basis for traffic law enforcement and a key component of bridge health monitoring and maintenance management, helping to ensure bridge structural safety, extend its service life, and maintain road traffic order.

The global Bridge Overweight Load Detection market size was estimated at USD 66.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.20% during the forecast period.
