Abstracts

Broaching services refer to a precision machining process that uses a broach tool—a long, linear cutting tool with multiple teeth arranged in increasing size—to remove material and form specific shapes or features on workpieces. This method is known for its high accuracy, efficiency, and ability to create complex geometries in a single pass. Core Principles of Broaching: A broach consists of a series of teeth, each slightly larger than the previous, allowing gradual material removal. Teeth are designed with specific rake angles, relief angles, and chip-breaking features to ensure smooth cutting. The broach is moved linearly across or through the workpiece (either by pulling or pushing), with each tooth removing a thin layer of material until the desired shape is achieved. Broaching services are valued for their ability to produce high - precision, complex features efficiently, making them essential in industries where part quality and repeatability are critical. While best suited for high - volume production, advancements in tooling and automation are expanding their applicability to smaller batches and more diverse materials.

The global Broaching Services market size was estimated at USD 1382.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
