A broadband achromatic lens is an optical component engineered to significantly reduce chromatic aberration across a wide spectrum of wavelengths, typically by combining two or more lens elements made from different types of glass with differing dispersion properties. This design corrects for the variation in refractive index with wavelength, allowing the lens to focus different colors of light to approximately the same point, thereby improving image clarity and color fidelity in applications ranging from scientific instruments and medical imaging to photography and laser systems. Its key performance attributes include high transmission efficiency, minimal spherical aberration, and consistent optical performance under diverse environmental conditions, making it a critical element in precision optical assemblies where accurate color reproduction and sharp focus are paramount.

The global Broadband Achromatic Lens market size was estimated at USD 128.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.25% during the forecast period.
