Abstracts

A broadband photodetector is a semiconductor-based optoelectronic device designed to convert a wide range of optical signals?spanning from ultraviolet (UV) to visible, near-infrared (NIR), and often into mid-infrared (MIR) wavelengths?into measurable electrical currents or voltages. Unlike wavelength-specific detectors, broadband photodetectors are characterized by their ability to operate efficiently across a broad spectral bandwidth, making them essential in applications requiring multi-wavelength or white-light detection. Key performance metrics include high responsivity, fast response times, low noise equivalent power (NEP), and wide linear dynamic range. These devices are typically fabricated using materials such as silicon, indium gallium arsenide (InGaAs), mercury cadmium telluride (MCT), or emerging two-dimensional materials like graphene, each offering distinct trade-offs between spectral coverage, speed, and sensitivity. They function through mechanisms such as photoconduction, photovoltaic effects, or photoelectromagnetic processes, depending on the design and application requirements.

The global Broadband Photodetector market size was estimated at USD 125.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
