Abstracts

A broadband triplet achromat is an optical lens that reduces chromatic aberration by combining lenses of different materials. Such lenses are typically made from three different glass materials, each with a different index of refraction. Combining these materials reduces the dispersion of the lens, thereby reducing chromatic aberration. The manufacture of such lenses requires a delicate process, because the refractive index of different materials must be precisely controlled. Broadband triplet achromatic lenses are often used in high-end camera lenses, telescopes, microscopes and other optical equipment to provide clearer and more accurate images.

The global Broadband Triple Bonded Achromatic Lens market size was estimated at USD 285.6 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.25% during the forecast period.
