Abstracts

Bromhexine hydrochloride is a well-established mucolytic agent primarily prescribed for the treatment of respiratory conditions characterized by excessive or viscous mucus, such as chronic bronchitis, asthma, and other obstructive pulmonary diseases. It functions by breaking down the structure of mucoproteins in bronchial secretions, thereby reducing mucus viscosity and facilitating expectoration. Available in various formulations including tablets, syrups, and solutions for inhalation, it is often used both as a standalone therapy and in combination with other agents like antibiotics or bronchodilators. As a derivative of the vasicine alkaloid, it has been in clinical use for decades and is generally regarded as safe and effective, though its mechanism is more supportive than curative, focusing on symptomatic relief and improvement in airway clearance.

The global Bromhexine Hydrochloride market size was estimated at USD 306.72 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.35% during the forecast period.
