Abstracts

Bromine trifluoride (BrF₃) is an inorganic interhalogen compound characterized by its highly reactive, corrosive, and toxic nature, existing as a straw-colored liquid at room temperature. It is primarily valued for its potent fluorinating and oxidizing properties, making it especially effective in converting various metal oxides to their corresponding fluorides, often under milder conditions compared to elemental fluorine. Due to its ability to act as a versatile fluorinating agent, BrF₃ is utilized in specialized industrial processes, including the production of uranium hexafluoride (UF₆) for nuclear fuel processing, the synthesis of certain fluorine-containing compounds in the chemical and pharmaceutical industries, and occasionally in laboratory-scale research for selective fluorination reactions. Its hazardous properties require strict handling protocols, specialized equipment, and controlled environments, limiting its application to niche, high-value sectors where alternative fluorinating agents are less effective or impractical.

The global Bromine Trifluoride (BrF₃) market size was estimated at USD 90.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
