Report Overview

A brushed DC motor is a type of DC motor. A fixed main magnetic pole and brushes are installed on the stator of the brushed motor, and an armature winding and a commutator are installed on the rotor. The electric energy of the DC power supply enters the armature winding through the brush and the commutator to generate the armature current. The magnetic field generated by the armature current interacts with the main magnetic field to generate electromagnetic torque, which makes the motor rotate to drive the load. Due to the existence of brushes and commutators, brushed motors have complex structure, poor reliability, many failures, heavy maintenance workload, short life, and commutation sparks are prone to electromagnetic interference.

The global Brushed DC Motor for Automotive Power Window market size was estimated at USD 339.70 million in 2023 and is projected to reach USD 614.10 million by 2032, exhibiting a CAGR of 6.80% during the forecast period.
