Abstracts

Buckypaper is a thin sheet of carbon nano-abrasive paper that is approximately 50,000 times thinner than a human hair. When buckypaper is stacked and compressed, it creates a material that is 500 times stronger than steel and 10% the weight of steel. The material has properties such as thermal conductivity, low light reflectivity, high strength-to-weight ratio, electrical conductivity, and EMI shielding. Due to its unique performance and characteristics, it is widely used in different fields such as electronics, automobiles, manufacturing, defense, medical transplantation, and filtration. Carbon nanotube paper (bucky paper) is composed of a certain length of disordered carbon nanotubes, which has a specific surface area much larger than carbon fiber paper, strength similar to that of thermally conductive graphite sheets, good electrical and thermal conductivity and chemical stability, and is used in fuel cells. Gas diffusion layers, electrochemical supercapacitors, lithium-ion battery cathodes, heat dissipation pads for high-power electronic devices, and high-performance polymer composite materials all have great application value. Carbon paper can be cleaned with pure water, dilute acid, dilute alkali, alcohol, and acetone. The strength of the wet state during the cleaning process is low. Do not stir or pull it. After cleaning, dry it with filter paper (or other absorbent materials that do not pollute the paper) and press it dry with a heavy object, otherwise it will warp. Soaking is generally not recommended for cleaning.
