Abstracts

A buffer and line driver is an electronic component or integrated circuit designed to isolate and strengthen digital signals, ensuring signal integrity by providing high input impedance to prevent loading the source and low output impedance to drive heavy capacitive or resistive loads over longer distances or across multiple devices; it acts as an intermediary that replicates the input signal at the output with increased current or voltage drive capability, making it essential in applications such as data communication systems, memory interfacing, bus driving, and clock distribution networks where signal degradation, noise, or fan-out limitations could otherwise compromise system performance.

The global Buffer And Line Driver market size was estimated at USD 1220.36 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
