Abstracts

Building automation generally refers to the use of advanced automation technologies and systems to monitor, control and optimize various facilities and services in buildings, such as lighting, temperature control, water heating systems, security systems, etc. These automation systems can significantly improve the energy efficiency and operational efficiency of buildings, reduce maintenance costs, and improve the comfort of living or working. As the core component of electronic devices, chips are the carriers of integrated circuits with a high degree of integration and complex functions. Through internal circuit and logic design, chips can realize functions such as processing, storage and transmission of external signals. Combining the two, we can understand "Building Automation Chips" as chips specifically used in building automation systems. These chips may integrate circuits and logic for monitoring and controlling various devices in buildings, and can receive data from sensors, process and issue control instructions to achieve automated management of various facilities in buildings.
