Abstracts

Burns are a common traumatic disease caused by physical or chemical factors, such as heat, chemistry, electric current and radiation. Small-area burns only cause damage to the skin and (or) mucosal tissue or the corresponding deep tissue. However, larger-area burns can cause functional, metabolic and morphological changes in various systems of the body to varying degrees, causing severe systemic reactions and visceral damage in the injured, and complications such as shock, sepsis and multiple organ failure, with a high mortality rate. The healing and treatment process of burn wounds is complex and takes a long time. After the wound heals, sequelae such as scar contracture and functional impairment may remain. Therefore, burns, especially large-area burns, are the most complex and serious traumatic diseases. In order to treat patients with large-area severe burns, in addition to the need for specialists to have solid basic medical knowledge and experience in burns, other departments such as general surgery, cardiothoracic surgery, urology, orthopedics, anesthesiology and internal medicine need to work together for consultation and treatment to form a team to achieve success. This is the result of collective efforts, cooperation and collaborative work. Burn and scald medicines refer to medicines used to treat skin or tissue damage caused by heat (such as flames, hot water, steam), chemicals, electric current or radiation. The main functions of these medicines are to relieve pain, prevent infection, promote wound healing and reduce scar formation. According to the severity and type of burns, burn and scald medicines can be divided into topical medicines, oral medicines and new therapies. The statistical object of this article is topical medicines for burns and scalds.

The global Burn and Scald Medicine market size was estimated at USD 454.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.70% during the forecast period.
