Abstracts

A bus terminator is an electronic component used to prevent signal reflections at the end of a transmission line, specifically a bus. When a signal travels along a transmission line, it encounters impedance changes, such as the end of the line. These impedance mismatches can cause the signal to reflect back towards the source, potentially interfering with subsequent transmissions. Bus terminators address this issue by providing a controlled impedance termination at the end of the bus.This termination absorbs the reflected signal, minimizing signal distortion and ensuring reliable data transmission.

The global Bus Terminators market size was estimated at USD 26680.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.70% during the forecast period.
