Abstracts

C C composite material, also known as carbon-carbon composite, is a high-performance material composed of carbon fibers embedded in a carbon matrix, resulting in a structure that is entirely carbon-based and exhibits exceptional thermal stability, mechanical strength, and resistance to thermal shock and ablation. It retains its structural integrity and properties at extremely high temperatures, often exceeding 2,000°C, making it uniquely suited for applications in extreme environments where most metals and ceramics would fail. Key characteristics include low density, high thermal conductivity, and excellent resistance to wear and corrosion, which contribute to its use in demanding sectors such as aerospace, defense, and industrial processing. The material is produced through processes like chemical vapor deposition or resin impregnation followed by carbonization, which densify the carbon matrix around the reinforcing fibers to achieve the desired mechanical and thermal properties.

The global C C Composite Material market size was estimated at USD 9850.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
