Abstracts

Cabazitaxel injection is a chemotherapeutic agent classified as a taxane derivative, specifically indicated for the treatment of hormone-refractory metastatic prostate cancer in combination with prednisone, following prior docetaxel-based therapy. It functions as a microtubule inhibitor, binding to tubulin to stabilize microtubule assemblies and disrupt mitosis, thereby inhibiting cancer cell proliferation. The drug is administered intravenously and is typically reserved for advanced-stage patients who have demonstrated disease progression despite initial treatments. As a second-line therapy, its clinical use is characterized by a targeted patient population with limited therapeutic alternatives, positioning it within the niche segment of oncology pharmaceuticals addressing late-stage prostate cancer management.

The global Cabazitaxel Injection market size was estimated at USD 588.2 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.85% during the forecast period.
