Report Overview

Cabinet X-ray Blood Irradiator is a specialized medical device used to irradiate blood products, such as red blood cells, platelets, and plasma, with X-rays. This process is performed to prevent graft-versus-host disease (GVHD) in patients who receive blood transfusions or bone marrow transplants. The irradiator exposes blood products to a controlled dose of X-ray radiation, which helps eliminate T-lymphocytes present in the blood products without damaging other components. By removing T-lymphocytes, the risk of GVHD, a potentially life-threatening condition, is significantly reduced.
